

Tune controller mod for DX-70 and DX-77

Author: Dan, kb7uxe

Some times ago I just wonder why they don't do this at the factory.

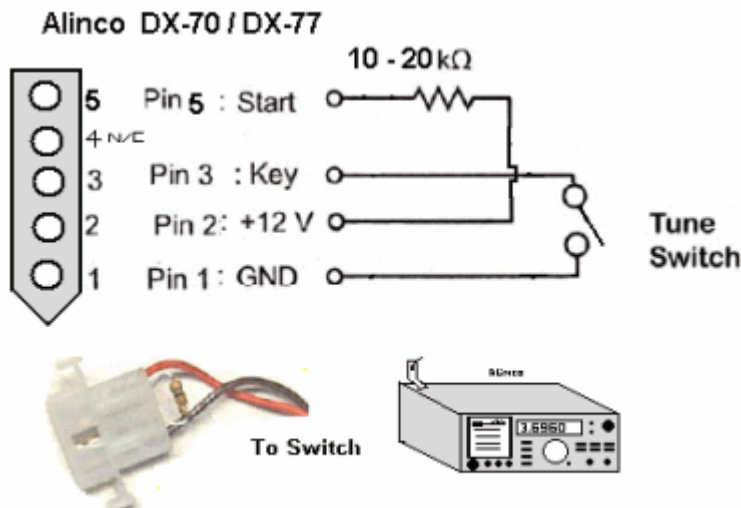

Here ya go, the manual Tune controller that:

- Automatically switches your rig to CW mode
- Automatically turns power down to 10 watts
- Automatically transmits CW CXR while tuning
- Automatically returns to previous mode and power setting when turned off.

A simple SPST can be mounted almost anywhere. A single 10 to 20 K ohm 1/4 watt resistor can be used. Just mount the switch connect the wire per diagram.

10K-20K ohm between pin 2 and 5,
switch wired to pin 1 and 3.

switch on = 10W CW CXR,
switch off= previous mode/power

Another fine mod by Dan kb7uxe.
